Education

Army Institute of Technology

July 2022 – present

BE in Electronics and Telecommunication Engineering

- **Relevant Coursework:** Data Structures and Algorithms(C++), Object-Oriented Programming, Web Application Development, Database Management System
- **Current SGPA:** 8.45

Experience

Software Developer Intern - Oracle India Pvt Ltd

Jan 2026 – Present

- Working as an individual contributor and project intern on Primavera Unifier, Oracle's enterprise project management product.
- Completed bootcamps in Prompt Engineering, Advanced Prompt Engineering, Java SE 21, OCI DevOps, OCI Gen AI, and Unix/Linux Essentials.
- Contributing to product-focused development tasks involving Unifier workflows, dashboard automation, and internal engineering utilities.
- Leveraging AI agents such as Codex and advanced prompt engineering to automate daily software tasks, create reusable skills, and improve engineering productivity.

Technical Skills

Languages: C, C++, Java

Technologies: HTML, CSS, MySQL, MongoDB, Mongoose

Tools & Platforms: Git, GitHub, VS Code, Proteus

Technical Projects

Oracle Dashboard Snapper (Python, Streamlit, Playwright, Typer, YAML)

- Built a local tool to authenticate into Oracle APEX dashboards, apply product and filter selections, and capture configured charts as PNG reports.
- Implemented storage-state login refresh, chart readiness checks, manifest-based output tracking, and both Streamlit UI and Typer CLI flows.
- Automated multi-product capture workflows using configurable YAML selectors, product folders, and reusable filter steps.
- Packaged the application with launcher and install scripts while excluding session state and generated outputs for secure sharing.

TubeNode Backend (Node.js, Express.js, MongoDB, Mongoose, JWT, Bcrypt, Multer, Cookie-Parser) [GitHub Link]

- Developing a YouTube-like video hosting backend using Node.js and Express, implementing user authentication, video upload, like/dislike, comments, subscriptions, and more.
- Followed RESTful design principles with some RPC-style endpoints, using clean modular architecture with separate folders for models, controllers, routes, middlewares, and utils.
- Implemented secure JWT-based authentication with access and refresh tokens, handled video uploads using Multer, and managed sessions via HTTP-only cookies using Cookie-Parser.

Traffic Violation Detection System

- Built a real-time traffic violation detection system using ESP32-S3, OV2640 camera, and basic vehicle hardware.
- Enabled Wi-Fi communication with backend server via HTTP; achieved 98% accuracy with 0.2s response time.
- Used on-chip RGB565 processing to detect light color on button press; triggered 5 buzzer beeps for red, 2 for green.
- Handled signal ambiguity from surrounding colored boards through optimized detection logic.

Honors and Achievements

- Winner, **BOSCH BOROSA 2.0 Hackathon 2025**
- Awarded the **Army Welfare Education Society (AWES) Scholarship** for academic excellence
- Earned the **NCC 'A' Certificate** (National Cadet Corps)
- Solved 350+ **DSA problems** across various platforms

Certificates

Data Structures and Algorithms in C++ **Certificate Link**

Additional certificates **Certificates**
